For example, for a 0.800 SG light oil the API gravity is $176.9 - 131.5 = 45.4$ oAPI SG = $141.5 / (131.5 + \text{oAPI})$
For example, for a 12 oAPI heavy oil the SG is $141.5 / 143.5 = 0.986$.

of pressure drop, the knowledge of multiphase flow regimes in pipes and liquid holdup are very important to the success of the facilities operation. To accurately predict holdup, flow regime at a given pressure, temperature, liquid velocities, superficial gas and other flow characteristics has to be well defined.

The pressure drop and the flow regimes of oil-water flow were studied in an inclined pipe. The experimental setup equipped with . a test section, storage . and separation tanks, centrifugal pump, flowmeter, differential pressure transducer to measure pressure drop and high viscous fluid system as shown in Figure 1.

nal flow where the conduit is completely filled with the fluid, and flow is driven primarily by a pressure difference. This should not be confused with open-channel flow where the conduit is partially filled by the fluid and thus the flow is partially bounded by solid surfaces, as in an irrigation ditch, and flow is driven by gravity alone.

the capacity of the existing oil and gas pipeline network, it results in bottlenecks and low prices at the production site. Soon, oil had replaced most other fuels for motorized transport. The automobile industry developed at the end of the 19th century, and quickly adopted oil as fuel. Gasoline engines were essential for designing successful aircraft.

the volumetric performance and pressure behavior of a reservoir vary in form and complexity depending upon the number of mobile fluids in the reservoir. There are generally three cases of flowing system: (1) single-phase flow (oil, water, or gas); (2) two-phase flow (oil-water, oil-gas, or gas-water); (3) three-phase flow (oil, water, and gas).

Changes from normal pressure gradients to overpressures can create or destroy pressure seals and create isolated pressure compartments that may define trap boundaries. In addition, the presence of a hydrodynamic gradient can cause tilted oil-water and gas-water contacts (See Fluid contacts), which define trap boundaries.
